During the Setup Hive will ask for storage location?

Means warehouse path in HDFS

Types of table in Hive

① Internal Table

- Table's metadata will be stored in metastore
- Data of the table will be stored in warehouse directory inside HDFS configured for Hive
- If we drop a ~~an~~ Internal table then its metadata & original data, both will be removed.

② External Table

- Metadata will be stored in metastore
- Raw data will not be stored in HIVE warehouse directory, it will be at HDFS location
- It is like external reference to the raw data
- If we remove the table then only metadata will be deleted, original data will be ~~not~~ untouched.
